Thermoplastic elastomers (TPEs) have the elastic behaviour of rubber and the processability of thermoplastics. The Freedonia Group has forecast that demand will expand by 6.4% per year to around 2.15 million tons in 2006. There is potential for these new, exciting materials to expand into the much larger thermoset rubber markets. This review includes comparisons between the two material types. There are three major types of TPE: block copolymers, rubber/plastic blends and dynamically vulcanised rubber/plastic alloys known as thermoplastic vulcanisates. The chemistry of these materials

A tale of sorcery and a princess in exile in a saga of an alternate Byzantine Empire by the Nebula Award–nominated author of Byzantium’s Crown. Alexa, princess of Byzantium, was destined to rule with her devoted brother Marric until the evil forces cast dark magic on her and made her betray him. Thus Marric feels under assault and a usurper has seized the throne—and by means both magical and moral, defeated Alexa. Saved by warrior allies, Alexa has been taken to an

unfamiliar northern land. Convinced of Marric's death, she is consumed by guilt—and fear. Even from afar, the usurper's power reaches out to trap her. Savage dreams terrorize her nights, prophecies of doom upset her days, and the fiery magic runs wild within her soul. Alexa's only hope lies amid the Druids of the distant Misty Isles. They alone can cleanse her of the darkness that infects her and teach her to use her powers well. But Alexa must learn more than just the secrets of the Druids, for within her hands and heart lie the very survival of Penilyn itself . . . and the fate of Byzantium.

Many variations of injection moulding have been developed and one of the rapidly expanding fields is multi-material injection moulding. This review looks at the many techniques being used, from the terminology to case studies. The three primary types of multi-material injection moulding examined are multi-component, multi-shot and over-moulding. The basic types of multi-material injection moulding, the issues surrounding combining different types of polymers and examples of practical uses of this technology are described.

This review first discusses mould release and then addresses mould fouling. Significant material and process variables are considered first and then practical guidance on the selection of release agents and surface treatments are addressed. This is followed by advice on mould cleaning and the assessment of mould sticking and mould fouling. An additional indexed section containing several hundred abstracts from the Rapra Polymer Library database gives useful references for further reading.

In their review, the authors summarise the state of the art in ABS polymers with major sections on synthesis, characterisation, mechanical properties and stabilisation. There are also sections on the most important speciality

This review discusses the different types of curing systems available today for different rubber types, including natural rubber, SBR, NBR, BR, IIR, CR, XIIR and EPDM. The uses of primary and secondary accelerators, prevulcanisation inhibitors (PVI) and antireversion chemicals are outlined. Typical rubber formulations for applications in industrial rubber products and tyres are given. Cure systems are described and compared with extensive tables of data on
